

DEVENDRA JHA

Full-Stack Developer · Logistics & Supply Chain Platforms · 2+ Years

+91-7283025404 · devashi7112011@gmail.com · Hyderabad, India · github.com/Devendra0711 · linkedin.com/in/devendra-softwaredveloper

PROFESSIONAL SUMMARY

Full-stack software engineer with 2+ years building and scaling a logistics platform (for LTL mode) that processes 1000+ daily orders as part of a \$100M+ supply chain program at Hub Group. My work as a full stack engineer has primarily spanned Node.js backend services, Vue 3 frontends, and event-driven systems built on RabbitMQ — with a strong focus on reducing manual operations and improving deployment reliability. Currently managing and contributing to multiple microservices, with direct ownership of 3+ services in the core dispatch process. Most comfortable working at the intersection of backend architecture, frontend integration, and DevOps.

TECHNICAL SKILLS

Languages & Frameworks: JavaScript, TypeScript, Vue 3 (Composition API), React, Node.js, Express.js, HTML, CSS

Frontend Tooling: Vuetify, Vuex, Vite, Webpack Module Federation

Databases & ORM: MongoDB (aggregation pipelines, indexing), Redis, SQL

Architecture Patterns: Microservices, Event-Driven Systems, REST API Design, Monolith-to-Microservice migration, Agile/Scrum

DevOps & Cloud: Docker, Jenkins, GitHub Actions, Git, Azure (Blob Storage, Service Bus)

Messaging & Monitoring: RabbitMQ, CloudAMQP, ELK Stack (Elasticsearch, Kibana), CloudWatch

Integrations: Boomi iPaaS, project44 carrier APIs, JWT auth

PROFESSIONAL EXPERIENCE

Associate Full-Stack Developer — Hub Group

Jan 2024 – Present | Hyderabad, India

Working on the 'Retire Miranda' initiative — an LTL (Less-Than-Truckload) mode integration project generating \$100M+ in revenue. My role spans backend API development, frontend feature work, and infrastructure improvements across this platform.

- Took ownership of the dispatch automation backend, which now handles 1000+ daily orders with minimal manual intervention, down from a heavily human-dependent process that required constant ops oversight.
- Work across a microservices architecture, with direct ownership of 3+ services handling the core dispatch process, responsible for their feature development, stability, and production deployments.
- Diagnosed and resolved significant API latency issues by restructuring MongoDB aggregation pipelines, adding targeted indexes on high-traffic collections, and layering Redis caching on frequently read datasets.
- Part of the Jenkins and Docker-based CI/CD workflow, after merging code, tag the build and coordinate deployments across Dev, QA, UAT, and Prod environments to keep each stage in sync.
- Wrote automated MongoDB migration scripts with rollback safety, cut production rollback incidents by 40% by reducing the risk surface of schema changes and data transformations.
- Implemented JWT-based authentication with structured audit logging across services, ensuring traceability for sensitive dispatch and customer operations.
- Onboarded 3,000+ customers into the platform's dispatch routing system, building the configuration workflows and validation logic needed to handle that volume cleanly.

KEY PROJECTS

Order Dispatch Automation System

Stack: *Node.js, Express.js, MongoDB, Boomi iPaaS, RabbitMQ, ELK Stack, project44, microservices, JavaScript, Vue*

- Led backend dispatch orchestration within a 6-engineer team, building the payload transformation and routing logic that connects internal services to external carrier platforms via Boomi iPaaS.
- Contributed to dispatch trigger configuration, added metadata flags for Dev and QA environments to control dispatch behavior during testing, while production flows run direct without environment-specific gates.
- Integrated project44 APIs for real-time shipment tracking, piping status updates back to the Vue.js frontend with consistent reliability even under high-throughput conditions.
- Centralized error observability using the ELK Stack, structured logging across all microservices meant production incidents that previously took hours to diagnose were getting resolved in under 30 minutes.
- The fully automated orchestration pipeline eliminated roughly 70% of manual dispatch workload that operations teams were handling previously.

Scale Toolbox — Frontend Modernization

Stack: *Vue 3, TypeScript, Vuetify, Webpack Module Federation, REST APIs*

- Drove the Vue 2 to Vue 3 migration as one of 2 frontend developers (alongside 3 backend engineers), establishing Composition API patterns and TypeScript conventions that became the team standard going forward.
- Architected a Macro Frontend + 3 Micro Frontend setup using Webpack Module Federation, which allowed separate teams to deploy their UI modules independently without coordinating releases.
- Created and published a shared Vue 3 component library to npm that standardized UI elements — including filters, search bar, pagination, buttons, data grids, filter breadcrumbs, error pages, page loaders, page headers, menu radio dropdowns, menu radio lists, search bar menus, menu select boxes, navbar, and app bar, enabling consistent frontend development across multiple internal applications.
- Integrated lazy-loaded tab interfaces and on-demand API execution that kept initial page load times low even as the number of data grids and billing views increased.

PERSONAL PROJECTS

Koshendra — Central Command for Internal Resources (AI Chatbot)

Stack: *Vue 3, Node.js, Express.js, MongoDB, JWT, bcrypt, Llama*

- Built an internal agentic AI chatbot designed to serve as the single point of reference for anyone navigating a complex multi-product platform, particularly useful for non-technical and technical users who need to understand system flows without any friction.
- The system covers 5 products, each with multiple modules. When a user asks about any part of the platform, Koshendra traces the relevant system flow and returns a clear, contextual answer, effectively acting as a live knowledge base for the entire application ecosystem.
- Used by Hub Group team members across 5 internal products, reducing onboarding queries to the IT team by approximately 60% by giving users direct, self-serve answers to system flow questions.
- Implemented secure user authentication using JWT and bcrypt, with full chat history persisted per user in MongoDB so conversations retain context across sessions.
- Designed the architecture so the chatbot can introspect platform structure and surface accurate answers regardless of which product or module is being queried, reducing dependency on IT staff to explain internal tooling.

EDUCATION

B.Tech in Computer Science Engineering

Rajiv Gandhi Proud yogiki Vishwavidyalaya (RGPV), Bhopal, India

2019 – 2023
